No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | SIDS1/gcgdata/geneseqn/geneseqn-embl/NA1980.DAT; *

ecreted, active, correctly folded, recombinant tissue plasminogen activator (tPA), Kringle 2 serine protease molecule (K2S) or their variants in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal peptide OmpA. The method is useful for producing recombinant DNA-derived tPA, K2S or their variants Sequences of the invention are useful for manufacturing a medicament for treating stroke, cardiac infarction, acute myocardial infarction, pulmonary embolism, any artery occlusion such as intracranial artery occlusion (e.g., arteries supplying the brain), peripherally occluded arteries, coronary artery occlusion, deep vain thrombosis or related diseases associated with unwanted blood clotting. The present sequence
                                                                                                                        Producing active, correctly folded recombinant tissue plasminogen activator, Kringle 2 serine protease in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal

                                                                                                                                                                               heterologous protein in prokaryotic cells, where the heterologous protein is secreted extracellularly as an active and correctly folded protein and
                                                                                                                                                                                                             the prokaryotic cell contains and expresses a vector comprising the DNA coding for the heterologous protein operably linked to the DNA coding for the signal peptide OmpA or its functional derivative. The method is useful for commercial large-scale production of heterologous proteins, e.g. K2S (kringle 2 plus serine protease), in prokaryotic cells, and is generally applicable in the expression of several different proteins and polypeptides which do not require mammalian glycosylation in prokaryotic host cells. The method may also be used to obtain DNA sequences of a protein of interest to be expressed from databases and cloned for use. The present sequence is human K2S heterologous protein N-terminal peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAT15487-T15498 are PCR primers used for the isolation and amplification of cDNA encoding a human megakaryocyte differentiation/proliferation factor, NTPO, some of the primers may also be used to engineer
                                                                                                                                                            The invention relates to a method for producing recombinant DNA-derived

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method of producing extracellularly accived, active, correctly folded, recombinant tissue plasminogen activator (tPA), kringle 2 serine protease molecule (K2S) or their variants in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal peptide OmpA. The method is useful for producing recombinant DNA-derived tPA, K2S or their variants Sequences of the invention are useful for manufacturing a medicament for treating stroke, cardiac infarction, acute myocardial infarction, occlusion such as intracranial artery occlusion (e.g., arteries supplying the brain), peripherally occluded arteries, coronary artery occlusion, deep vain thrombosis or related diseases associated with unwanted blood clotting. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Producing active, correctly folded recombinant tissue plasminogen activator, Kringle 2 serine protease in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal
recombinant NTPO DNA. DNA encoding the factor can be used to produce a recombinant NTPO at a high yield. NTPO is useful for the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               diseases associated with unwanted blood clotting. The present sequence is a PCR primer which is used for amplifying human tissue plasminogen activator (tPA) gene. This primer is used in the exemplification of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for producing recombinant DNA-derived heterologous protein in prokaryotic cells, where the heterologous protein the secreted extracellularly as an active and correctly folded protein and the prokaryotic cell contains and expresses a vector comprising the DNA coding for the signal peptide OmpA or its functional derivative. The method is useful for commercial large-scale production of heterologous proteins, e.g. KZS (Kringle 2 plus serine protease), in prokaryotic cells, and is generally applicable in the expression of several different proteins and polypeptides which do not require mammalian glycosylation in prokaryotic host cells. The method may also be used to obtain DNA sequences of a protein of interest to be expressed from databases and cloned for use.
                                                                                                                                                                                                                                                    Human tissue plasminogen activator (tPA) gene amplifying primer, sK2/174.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AATIGO11-T16014 are PCR primers used for the isolation and amplification of the human tissue-plasminogen activator (t-PA) gene. The T-PA gene may be incorporated into a plasmid contg. DNA encoding a megakaryocyte differentiation/proliferation factor, NTPO, so as expression produces a chimeric t-PA-NTPO protein. DNA encoding the factor can be used to produce a recombinant NTPO at a high yield. NTPO is useful for the treatment of thrombocytopenia either alone or in conjunction with
                                                                    Human tissue-plasminogen activator (t-PA) gene N-terminal PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Megakaryocyte differentiation/proliferation factor - and fragments of it are prepared by recombinant techniques and used for treatment of thrombocytopenia

Tissue plasminogen activator; tPA; kringle 2 serine protease; stroke; KZS; carddac infarction; pulmonary embolism; artery occlusion; deep vein thrombosis; blood clotting; thrombolytic; cerebroprotective; cardiant; ompA; enzyme; human; gene; ds.
              The sequences given in AAQ40663-64 are cDNAs encoding tissue plasminogen activator (LPA) muteins, LPA-7 and LPA-8. These muteins are truncated versions of LPA (see AAQ40654). LPA-7 further comprises a Glu-Argy-Tyr-His muteation amino acide corresponding to amino acide 303-304 of LPA and tPA-8 further contains a deletion of amino acide sorresponding to amino acide 296-302 of tPA, and the mutation contained in tPA-7. The plasmid pTB 1277 was treated with the synthetic oligomers given in AAQ40661-62 in an in vitro mutagenesis system. The tPA muteins, tPA-7 and -8 have good stability in blood and good physiological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               secreted, active, correctly folded, recombinant tissue plasminogen activator (FPA), Kringle 2 serine protease molecule (K2S) or their variants in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal peptide OmpA. The method is useful for producing recombinant DNA-derived tPA, K2S or their variants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             activator, Kringle 2 serine protease in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal peptide OmpA -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method of producing extracellularly

                                                                                                                                                                                  The sequences given in AAQ40657-58 are cDNAs encoding tissue plasminogen
                                                                                                                                                                                               activator (tPA) muteins, TPA-1 and tPA-2. These muteins are truncated versions of tPA (see AAQ40654) and tPA-2 further contains a deletion of amino acids corresponding to amino acids 296-302 of tPA. The plasmid pTB 1127 was treated with the synthetic oligomers given in AAQ40655-56 in an in vitro mutagenesis system. The tPA muteins, tPA-1 and -2 have good stability in blood and good physiological activity.

       for treating stroke, cardiac infarction, acute myocardial infarction, pulmonary embolism, any artery occlusion such as intracranial artery occlusion (e.g., arteries supplying the brain), peripherally occluded arteries, coronary artery occlusion, deep vein thrombosis or related diseases associated with unwanted blood clotting. The present sequence is human X2S DNA.
                                                                                                                      Gaps
Sequences of the invention are useful for manufacturing a medicament

CC Site-directed mutagenesis was carried out on a human tPA cDNA
CC template. The resulting mutated coding sequence encoded a Met
CC residue followed by amino acids 174-527 (i.e. the Kringle 2
CC and protease domains) of mature wild-type tPA. The mutein has
CC increased thrombolytic activity and very little reactivity to
CC fibrinogen. Monoclonal antibodies specific for fibrin are used in
CC the production of bispecific monoclonal antibodies which also
CC recognise truncated tPA muteins such as tPA-1 lacking the finger,
CC EGF and Kringle 1 domains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 48, 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 18405, Application US/09864761
Patent No. US2002048763A1
GENERAL INFORMATION:
APPLICANT: Penn, Sharron G.
APPLICANT: Rank, David R.
APPLICANT: Chen, Wensheng
TITLE OF INVENTION: HUMAN GENOME-DERIVED SINGLE EXON NUCLEIC ACID PROBES USEFUL FOR TITE OF INVENTION: GENE EXPRESSION ANALYSIS BY MICROARRAY
                                                                                                                                                                                                                                                                                                APPLICANT: Byrum, Joseph R.
APPLICANT: Byrum, Joseph R.
APPLICANT: La Rosa, Thomas J.
APPLICANT: Thompson, Michael D.
TITLE OF INVENTION: Nacleic Acid Molecules and Other Molecules Associated with
TITLE OF INVENTION: Plants
FILE REFERENCE: 38-21(15401)B
CURRENT APPLICATION NUMBER: US/109/878,574
CURRENT FILING DATE: 2001-12-21
PRIOR APPLICATION NUMBER: 09/333,535
PRIOR FILING DATE: 1999-06-14
NUMBER OF SEQ ID NOS: 15775
SEQ ID NO 237
LENGTH: 139
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô

//note="Organ: Liver; Vector: pcNS-D2; Site 1: EcoRI;
Site 2: NotI; The poly (A) + RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including EcoRI site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nc. The cDNA vector was circularized with E. coli DNA ligase after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by GXsyama—Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli ToplOF' by electroporation method. The cDNA libraries constructed by this method are full-length enriched cDNA library."

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                   secreted, active, correctly folded, recombinant tissue plasminogen activator (LPA), Kringle 2 serine protease molecule (K2S) or their variants in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal peptide OmpA. The method is useful for producing recombinant DNA-derived tPA, K2S or their variants. Sequences of the invention are useful for manufacturing a medicament for treating stroke, cardiac infarction, acute myocardial infarction, pulmonary-embolism, any artery occlusion such as intracranial artery occlusion (e.g., arteries supplying the brain, peripherally occluded arteries. coronary artery occlusion, deep vein thrombosis or related diseases associated with unwanted blood clotting. The present sequence is a DNA fragment encoding Escherichia coli OmpA peptide.

```
The invention relates to a method for producing recombinant DNA-derived heterologous protein in prokaryotic cells, where the heterologous protein is secreted extracellularly as an active and correctly folded protein and the prokaryotic cell contains and expresses a vector comprising the DNA coding for the heterologous protein operably linked to the DNA coding for the signal peptide OmpA or its functional derivative. The method is useful for commercial large-scale production of heterologous proteins, e.g. KZS (Kringle 2 plus serine protease), in prokaryotic cells, and is generally applicable in the expression of several different proteins and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tissue plasminogen activator; tPA; kringle 2 serine protease; stroke; K2S; cardiac infarction; acute myocardial infarction; pulmonary embolism; artery occlusion; deep vein thrombosis; blood clotting; thrombolytic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polypeptides which do not require mammalian glycosylation in prokaryotic host cells. The method may also be used to obtain DNA sequences of a protein of interest to be expressed from databases and cloned for use. The present sequence is Escherichia coli OmpA DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 ATGAAAAAGACAGCTATCGCGATTGCAGTGGCACTGGCTTTCGCTACCGTGGCCCAG
Producing recombinant DNA-derived kringle 2 plus serine protease, comprises using a prokaryotic cell expressing a vector having a DNA coding for a heterologous protein operably linked to a DNA coding for the signal peptide OmpA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                               ö
                                                                                                             The present invention relates to a method of producing extracellularly secreted, active, correctly folded, recombinant tissue plasminogen activator (tPA), rkingle 2 serine protease molecule (K2S) or their variants in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal peptide OmpA. The method is useful for producing recombinant DNA-derived tPA, K2S or their variants. Sequences of the invention are useful for manufacturing a medicament for treating stroke, cardiac infarction, acute myocardial infarction, pulmonary embolism, any artery occlusion such as intracranial artery occlusion (e.g., arteries supplying the brain), peripherally occluded arteries, coronary artery occlusion, deep vein thrombosis or related diseases associated with unwanted blood clotting. The present sequence is a DNA encoding a fusion protein comprising OmpA and K2S protein.
                                                                                                                                                                                                                                                                                                                                                      9

This fusion protein comprises an exogenous protein fused to the amino terminus of a filamentous phage pVII or pIX protein. This is useful in the design of proteins for medical,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   851
which can be used as the test reagent to detect the surface antigen of hepatitis B in blood. The dual-specific antibody is prepared by recombination technique in gene engineering. The recombination technique includes reforming the surface antigen to resist against erythrocyte and hepatitis B to become hybrid antibody genes by shortening the same expression vector. The gene product can be directly extracted from the superinatant of bacterial culture liquid. Its advantages are low
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel filamentous phage encapsulating a genome encoding fusion polypeptide comprising exogenous polypeptide fused to amino terminus of pVII and pIX proteins, for constructing diverse heterodimeric polypeptide array
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 ATGAAAAAGCTATCGCGATTGCAGTGGCACTGGCTGGTTTCGCTACCGTGGCCCAG

This sequence represents the pComb3 phagemid expression vector. This vector has been designed to allow for anchoring of expressed proteins on the bacteriophage coat protein 3. Gene III of filamentous phage encodes the bacteriophage coat protein, cplII (cp3), which is expressed prior to extrusion in the phage assembly process on a bacterial comparison and accumulates on the inner membrane facing into the periplasm of express various mutagenised human Fab's which comprise heavy and light convariable regions which bind to HIV gp120. pComb3 allows for both surface display and soluble forms of the Fabb. The vector was designed for the cloning of combinatorial Fab libraries. pComb consists of a DNA molecule cloning of combinatorial Fab libraries. pComb consists of a DNA molecule coloning vocassettes to express one fusion protein, Fd/cp3, and one soluble protein, the light chain. The finished vector comprises, prometer/operator sequences, a NoII restriction site, a ribosome binding site (RBS), a PelB leader, a spacer region, a cloning region bordered by 5' XhoI and 3' SpeI restriction sites, the tether sequence, the sequences encoding bacteriophage cp3 followed by a stop codon, a NeII restriction site between the two cassettes, and a second lac2 promoter/operator cegenon, a cloning region bordered by 5' SacI and 3' SpeI restriction control RBS, a PelB leader, a spacer region, a cloning region bordered by 5' SacI and 3' SpeI restriction control RBS, a PelB leader, a spacer cegion, a cloning region bordered by 5' SacI and 3' SpeI restriction control RBS, a PelB leader, a spacer region, a cloning region bordered by 5' SacI and 3' SpeI restriction control stop sequences and a second NotI restriction site. The pComb3 expression control stop sequences and a second NotI restriction site. The pComb3 expression vector forms the basic

The present invention describes an immunoglobin molecule or its fragment (1) comprising a region where amino acid residues corresponding to at least a portion of the complementary determining region (CDR) are replaced or fused with biologically active peptides e.g. a peptide mimetic such as an erythropoletin (BPO) or thrombopoletin (TPO) mimetic, that is flanked with proline at its carboxy terminus. (1) has antianaemic, haemostatic and nephrotropic activities, and can be used as a stimulator of proliferation, differentiation and maturation of haematopoletic cells, and a stimulator of haematopolesis. (1) is useful for stimulating proliferation, differentiation or growth of promegakaryocytes or megakaryocytes, where (1) is contacted with promegakaryocytes or megakaryocytes, which results in increased platelet production. (1) with a region where amino acid residues corresponding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A novel immunogen molecule comprising a region in which amino acid residues corresponding to at least a portion of the complementary determining region are replaced or fused with an erythropoietin or

                     The present sequence is of plasmid pLR8, a pComb vector family member. pLR8 was constructed by insertion of a PCR fragment containing a flexible linker (murine kappa hinge region) followed by a Jun leucine zipper dimerisation domain into a pRL4 backbone that had been treated to remove the stuffer region. The resulting construct was then cut with restriction endonucleases to replace serv with a pRL4 stuffer region for the light and heavy chain. The vector is useful in the production of biologically active proteins biological activity. It can also be used in the production and screening of librarismation of single chain antibodies is accomplished by the presence of the Jun leucine zipper domain, which is responsible for protein-protein interactions. Subcloning to pRL8 individually or en masse following FACS sorting or panning allows expression, e.g., of dimeric soluble Fabs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Plasmid, vector; replication, expression, foreign genetic, bacteria; cyanobacterium; Bscherichia coli; pComb3X plasmid; pRL5; pRL5 asc-CAT; pRL5-CAT; pRL5 bsi-CAT; gene; ds.

                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                The invention relates to a plasmid with a nucleic acid sequence of 6122, 6125, or 5683 base pairs fully defined in the specification. The invention more specifically relates to novel vectors capable of replication and expression of foreign genetic information in bacteria, such as, for example, cyanobacterium and E. coli. The new vectors have been designed to overcome certain drawbacks of the pComb3x plasmid. These new vectors include pRLS, pRLS-CAT, pRLS asc-CAT and pRLS bsi-CAT. This polynucleotide sequence represents the plasmid pRLS nucleic acid sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     *tag= e

The invention more specifically relates to novel vectors capable of replication and expression of foreign genetic information in bacteria, such as, for example, cyanobacterium and E. coli. The new vectors have been designed to overcome certain drawbacks of the pComb3X plasmid. These new vectors include pRL5, pRL5-CAT, pRL5 asc-CAT and pRL5 bsi-CAT. This sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
